2.1 Gaussian distribution

2.1.1 MLE of Gaussian Distribution

Definition 2.1.1. 一次元 *Gaussian distribution* : $p(x) = \frac{1}{\sqrt{2\pi}\sigma} \exp(-\frac{(x-\mu)^2}{2\sigma^2})$

θ_{MLE}:

$$\theta_{MLE} = \underset{\theta}{argmax}\, p(x|\theta) = \log \prod_{i=1}^{N} p(x_i|\theta) \tag{2.1}$$

$$= \sum_{i=1}^{N} \log \frac{1}{\sqrt{2\pi}\sigma} \exp(-\frac{(x-\mu)^2}{2\sigma^2}) = \sum_{i=1}^{N} \left[\log \frac{1}{2\pi} + \log \frac{1}{\sigma} - \frac{(x_i-\mu)^2}{2\sigma^2} \right] \tag{2.2}$$

μ_{MLE}:

$$\mu_{MLE} = \underset{\mu}{argmax} \log p(x|\theta) = \underset{\mu}{argmax} \sum_{i=1}^{N} -\frac{(x_i-\mu)^2}{2\sigma^2} \tag{2.3}$$

$$= \underset{\mu}{argmin} \sum_{i=1}^{N} (x_i-\mu)^2 \tag{2.4}$$

σ^2_{MLE}:

$$\sigma^2_{MLE} = \underset{\sigma}{argmax} \tag{2.5}$$

$$= \underset{\sigma}{argmax} \sum_{i=1}^{N} \left(-\log \sigma - \frac{1}{2\sigma^2}(x_i-\mu)^2 \right) \tag{2.6}$$

$\mu Extremum$: Unbiased estimate

$$\frac{\partial}{\partial \mu} \sum_{i=1}^{N} (x_i - \mu)^2 = \sum_{i=1}^{N} 2 \cdot (x_i - \mu) \cdot (-1) = 0 \tag{2.7}$$

$$\sum_{i=1}^{N} (x_i - \mu) = \sum_{i=1}^{N} x_i - \sum_{i=1}^{N} \mu = 0 \tag{2.8}$$

$$\mu_{MLE} = \frac{1}{N} \sum_{i=1}^{N} x_i \tag{2.9}$$

$\sigma Extremum$: Biased estimate (Unbiased estimate : $\frac{1}{N-1} \sum_{i=1}^{N} (x_i - \mu)^2$)

$$\frac{\partial}{\partial \sigma} \sum_{i=1}^{N} \left(-\log \sigma - \frac{1}{2\sigma^2}(x_i - \mu)^2 \right) = 0 \tag{2.10}$$

$$\sum_{i=1}^{N} \left[-\frac{1}{\sigma} - \frac{1}{2}(x_i - \mu)^2 \cdot (-2)\sigma^{-3} \right] = 0 \tag{2.11}$$

$$\sum_{i=1}^{N} \left[-\frac{1}{\sigma} + (x_i - \mu)^2 \cdot \sigma^{-3} \right] = 0 \tag{2.12}$$

$$\sum_{i=1}^{N} \left[-\sigma^2 + (x_i - \mu)^2 \right] = 0 \tag{2.13}$$

$$\sum_{i=1}^{N} \sigma^2 = \sum_{x_i}^{N} (x_i - \mu)^2 \tag{2.14}$$

$$\sigma_{MLE}^2 = \frac{1}{N} \sum_{i=1}^{N} (x_i - \mu_{MLE})^2 \tag{2.15}$$

$$= \frac{1}{N} \sum_{i=1}^{N} (x_i^2 - 2x_i \mu_{MLE} + \mu_{MLE}^2) \tag{2.16}$$

$$= \frac{1}{N} \sum_{i=1}^{N} x_i^2 - 2\mu_{MLE}^2 + \mu_{MLE}^2 \tag{2.17}$$

$$= \frac{1}{N} \sum_{i=1}^{N} x_i^2 - \mu_{MLE}^2 \tag{2.18}$$

2.1.2   Biased estimate vs Unbiased estimate

Unbiased estimate :

$$E[\mu_{MLE}] = E\left[\frac{1}{N}\sum_{i=1}^{N}x_i\right] = \frac{1}{N}\sum_{i=1}^{N}E[x_i] = \frac{1}{N}\sum_{i=1}^{N}\mu = \mu \tag{2.19}$$

Biased estimate:

$$E[\sigma_{MLE}^2] = E\left[\frac{1}{N}\sum_{i=1}^{N}x_i^2 - \mu_{MLE}^2\right] \tag{2.20}$$

$$= E\left[\left(\frac{1}{N}\sum_{i=1}^{N}x_i^2 - \mu^2\right) - \left(\mu_{MLE}^2 - \mu^2\right)\right] \tag{2.21}$$

$$= E\left[\frac{1}{N}\sum_{i=1}^{N}x_i^2 - \mu^2\right] - E\left[\mu_{MLE}^2 - \mu^2\right] \tag{2.22}$$

$$= E\left[\frac{1}{N}\sum_{i=1}^{N}(x_i^2 - \mu^2)\right] - E[\mu_{MLE}^2] - E[\mu^2] \tag{2.23}$$

$$= \frac{1}{N}\sum_{i=1}^{N}E[x_i^2 - \mu^2] - E[\mu_{MLE}^2] - \mu^2 \tag{2.24}$$

$$= \frac{1}{N}\sum_{i=1}^{N}(E[x_i^2] - \mu^2) - E[\mu_{MLE}^2] - E^2[\mu_{MLE}] \tag{2.25}$$

$$= \frac{1}{N}\sum_{i=1}^{N}Var[x_i] - Var[\mu_{MLE}] \tag{2.26}$$

$$= \frac{1}{N}\sum_{i=1}^{N}\sigma^2 - Var\left[\frac{1}{N}\sum_{i-1}^{N}x_i\right] \tag{2.27}$$

$$= \sigma^2 - \frac{1}{N^2}\sum_{i=1}^{N}\sigma^2 \tag{2.28}$$

$$= \sigma^2 - \frac{1}{N}\sigma^2 \tag{2.29}$$

$$= \frac{N-1}{N}\sigma^2 \tag{2.30}$$

2.4.7   SVMs

間隔を最大化する分類器。ジオメトリ (geometric) 意義は凸最適化問題 (Convex optimization) に変換されます。元の問題はラグランジュ乗数法 (Lagrange multiplier) によって制約のない問題に変換されます。単純なデータの場合は二次計画法 (Quadratic programming) の問題であり、複雑な問題の場合は二元性 (Duality), カーネル (Kernel) の考え方を使用します。

ハードマージンSVM(hard margin svm) :

$$s.t. \left\{ (x_i, y_i) \right\}_{i=1}^{N}, x_i \in \mathbb{R}^p, y_i \in \{-1, 1\}$$

$$
\begin{cases}
\max\limits_{w,b} \min\limits_{x_i:x_n} \frac{1}{\|w\|} y_i(w^t x_i + b) \\
Define:\ y_i(w^t x_i + b) > 0,\ for\ \forall\ i = 1, \ldots, N
\end{cases}
\implies
\begin{cases}
\min\limits_{w,b} \frac{1}{2} w^t w \\
s.t.\ y_i(w^t x_i + b) \ge 1,\ for\ \forall\ i = 1, \ldots, N
\end{cases}
$$

$$(2.198)$$

ソフトマージンSVM(soft margin svm) :

$$
\begin{cases}
\min\limits_{w,b} \frac{1}{2}w^t w + C \sum_{i=1}^{N} max\{0, 1 - y_i(w^t x_i + b)\} \\

\end{cases}
\tag{2.199}
$$

二元性 (Duality):

弱い双対性 (Weak duality) は $min\,max \geq max\,min$ です；強い双対性 (Strong duality) は $min\,max \geq max\,min$ です。元の問題の目的関数は 2 次であり、その制約は線形であるため、強い双対性です。

2.4.8   Kernel Method

低次元の非線形分離可能データを高次元の線形分離可能データに変換する場合、低次元ベクトルを計算して高次元ベクトルにマッピングし、内積（SVM）を見つけることは非常に複雑です。 この点で、高次元ベクトルの内積はカーネル法によって直接取得できます。

Theorem 2.4.4. *positive definite kernel:*

$\forall x, x' \in \mathcal{X}, \exists K(x, x');$
If: $\exists \phi : \mathcal{X}, \phi \in \mathcal{H};$
Then: $Kernel(x, x') = <\phi(x), \phi(x')>$

2.5 Dimensionality Reduction

2.5.1 PCA

PCA(Principal components analysis) は元の特徴空間の再構築 (2 つの線形関連変数を 2 つの線形独立変数に変換します)。射影分散 (Covariance) を最大化する，再構成距離を最小化する (元のデータを再構築するためのコスト)，$u_{mapping\ vector}$ は PCA の PC(Principal components) です。

射影分散 (Covariance) 最大化:

$s.t.\ u^t_{mapping\ vector} \cdot u_{mapping\ vector} = 1$

$$
argmax\ \frac{1}{N}\sum_{i=1}^{N}((x_i-\hat{x})^t u_{mapvect})^2 = u^t_{mapvec} \cdot S \cdot u_{mapvec} \tag{2.201}
$$

$$
\tag{2.202}
$$

Optimizationfunction: ラグランジュ乗数 (Lagrange Multiplier)

$$
\mathfrak{L}(u,\lambda) = u^t_{mapvec} \cdot S \cdot u_{mapvec} + \lambda(u^t_{mapvec} \cdot u_{mapvec} - 1) \tag{2.203}
$$

再構成距離を最小化:

$s.t.\ u_k^t \cdot u_k = 1$

$$argmax \sum_{i=1}^{N} \Big\| \sum_{k=1}^{p}(x_i^t u_k)u_k - \sum_{k=1}^{q}(x_i^t u_k)u_k \Big\| \ = \ \sum_{k=q+1}^{p} u_k^t \cdot S \cdot u_k \tag{2.204}$$

$$= \sum_{k=q+1}^{p} \lambda_i \tag{2.205}$$

参照:

$Data:\ X \in \mathbb{R}^{n \times p}$

$$Sample\ Mean:\ \hat{x}_{p \times 1} = \frac{1}{N}\sum_{i=1}^{N} x_i = \frac{1}{N}X^t I_N \tag{2.206}$$

$$Sample\ Covariance:\ S_{p \times p} = \frac{1}{N}\sum_{i=1}^{N}(x_i - \hat{x})(x_i - \hat{x})^t = \frac{1}{N}X^t H_{centering\ matrix}X \tag{2.207}$$

2.5.2 PCA vs SVD

実はデータセンタリング (Data centralization) 後の SVD 分解と共分散行列 (Covariance matrix) で固有値分解の意味は同じです。だからデータセンタリング後の SVD 分解の方法が共分散行列 (Covariance matrix) の計算しなくでもいい、早いです。

$$S = \frac{1}{N}X^t H X = X^t H^t H X = V\Sigma U^t \cdot U\Sigma V^t = V\Sigma^2 V^t \tag{2.208}$$

2.5.3 P-PCA

P-PCA(Probabilitic PCA) は線形ガウスモデル (Linear Gaussian model) です、ターゲットを隠れ変数に変換し、最尤法 (MLE) でモデルを作成し、EM 使用して取得されます。隠れた変数は特定の分布に従います。

$s.t.\ x(observed\ data) \in \mathbb{R}^p,\ z(latent\ variable) \in \mathbb{R}^q,\ q < p$

$$\begin{cases} z \sim N(0_q, I_q) \\ x = wz + \mu + \varepsilon \\ \varepsilon \sim N(0, \sigma^2 I_p) \end{cases} \implies \begin{cases} Inference:\ P(z|x) \\ Learning(EM):\ w, \mu, \sigma^2 \end{cases}$$

2.5.4 EM For GMM

EM:

$$\theta^{(t+1)} = \underset{\theta}{argmax} \int_z \log P(x,z|\theta) \cdot P(z|x,\theta^{(t)})dz \tag{2.209}$$

E-step: $p(z|x,\theta^t) \to E_{z|x,\theta^t}[\log p(x,z|\theta)]$;
M-step: $\theta^{t+1} = \underset{\theta}{argmax} \, E_{z|x,\theta^t}[\log p(x,z|\theta)]$

EM For GMM: Define:
X: observed variable;
Z: latent variable(clusterer)
$X|Z = C_k \sim N(X|\mu_k \Sigma_k)$
$\theta = (p_1,...,p_k,\mu_1,...,\mu_k,\Sigma_1,...,\Sigma_k)$

3.4.1   Probability distribution sampling

$$x^{(i)} = cdf^{-1}(y^{(i)}) \tag{3.71}$$

Figure 3.4: PDF を CDF に変換

3.4.2   Rejection sampling

必要な分布 $mq(z)$ は非常に複雑であり、直接サンプリングできないため、単純な分布 $q(z)$(proposed distribution) 提案分布を作成します $(\forall z^{(i)}, mq(z^i)) \geq p(z^{(i)})$。 ランダムサンプリングが 2 つの分布の間にある場合は拒否され、真の分布内にある場合は受け入れられます。Acceptance rate が高いほど、サンプリング効率が高くなります。

$$Acceptance\ rate = \frac{p(z^{(i)})}{mq(z^{(i)})} \tag{3.72}$$

EM(Expectation maximization)Algorithm は座標昇順法 (Coordinate descent) のような反復更新。実は ELBO(Evidence lower bound) を最大化します。

$$\theta^{(t+1)} = \underset{\theta}{argmax} \int_z \log P(x,z|\theta) \cdot P(z|x,\theta^{(t)})dz \tag{3.280}$$

E-step: $p(z|x,\theta^t) \rightarrow E_{z|x,\theta^t}[\log p(x,z|\theta)]$;
M-step: $\theta^{t+1} = \underset{\theta}{argmax}\, E_{z|x,\theta^t}[\log p(x,z|\theta)]$

Proof. $\log p(x|\theta) = ELBO + KL(q||p)$

$$\log p(x|\theta) = \log p(x,z|\theta) - \log p(z|x,\theta) \tag{3.281}$$

Proof.

$$\log p(x|\theta) = \log \int_z p(x,z|\theta)dz \tag{3.288}$$

$$= \log \int_z \frac{p(x,z|\theta)}{q(z)} \cdot q(z)dz \tag{3.289}$$

$$= \log E_{q(z)}\left[\frac{p(x,z|\theta)}{q(z)}\right] \tag{3.290}$$

$$\geq E_{q(z)}\left[\log \frac{p(x,z|\theta)}{q(z)}\right] \tag{3.291}$$

If $\frac{p(x,z|\theta)}{q(z)} == C$ then "=";

$$\therefore q(z) = \frac{1}{c}p(x,z|\theta) \tag{3.292}$$

$$1 = \int_z q(z)dz = \int_z \frac{1}{c}p(x,z|\theta)dz \tag{3.293}$$

$$= \frac{1}{c}\int_z p(x,z|\theta)dz \tag{3.294}$$

$$1 = \frac{1}{c}p(x|\theta)dz \tag{3.295}$$

$$c = p(x|\theta) \tag{3.296}$$

$$\therefore q(z) = \frac{1}{p(x|\theta)} p(x, z|\theta) = p(z|x, \theta) \tag{3.297}$$
